This is a high-contrast, black and white image, likely a scan of a textured surface such as a book cover or endpaper. The image is characterized by a dark, grainy background on the left and a lighter, more detailed area on the right. The right side shows a complex, fibrous texture, possibly representing the binding or a specific material. The overall appearance is abstract and textured, with no discernible text or figures.

FIG. 14C

Figure 1 consists of three Northern blot panels, each showing the expression of a different cytokine: IL-1 $\beta$ , IL-4, and IL-8. Each panel is divided into two groups of lanes: RG (Resuscitation Group) and HG (Hypothermia Group). The RG group contains four lanes, and the HG group contains four lanes. The blots show varying levels of mRNA expression, with IL-1 $\beta$  and IL-8 showing strong, consistent bands across all lanes, and IL-4 showing a more pronounced decrease in the final two lanes of the HG group.
